Topic 14: Switch Node & Workflow Routing

Project Overview

This project demonstrates how to use the Switch node in n8n to route multiple user profiles into different workflow branches based on their roles.

The workflow uses three comparison rules (admin, editor, viewer) and one default fallback branch for unmatched roles.

Objective

- Understand the Switch node.
- Configure multiple routing rules.
- Use dynamic expressions to read JSON properties.
- Configure a default fallback output.
- Process multiple input items.
- Connect separate downstream Edit Fields nodes.

Workflow Structure

```
None
Manual Trigger
     |
Input User Profiles
     |
Split Out
     |
Route Users by Role (Switch)
     |
     |-- Output 0 --> Set Admin Status
     |-- Output 1 --> Set Editor Status
     |-- Output 2 --> Set Viewer Status
     |-- Fallback --> Set Guest Status
```

Sample Input

Name	Role
Alex	admin
Sarah	editor
John	viewer
David	guest

Switch Configuration

- Mode: Rules
- Expression: `{{ $json.role }}`
- Rule 0: admin
- Rule 1: editor
- Rule 2: viewer
- Fallback Output: Extra Output

Expected Results

Profile	Expected Branch
Alex	Admin
Sarah	Editor
John	Viewer
David	Guest / Fallback

Downstream Actions

- Set Admin Status: `isAdmin = true`
- Set Editor Status: `isEditor = true`
- Set Viewer Status: `isViewer = true`
- Set Guest Status: `isGuest = true`

Execution

1. Execute the Manual Trigger.
2. Verify the Input User Profiles node.
3. Verify the Split Out node produces four items.
4. Execute the Switch node.
5. Verify all four output branches.
6. Verify the downstream Edit Fields nodes.

Final Result

All four profiles were successfully routed to their respective branches, and all four downstream Boolean outputs were verified successfully.

Overall Status: PASS
